

How to Write Scenarios?

Third US/Europe AP5-9 Practitioners' Workshop

San Jose – California – USA – 2/11/2004

Robin DERANSY – with material from Nicholas HUNT (GTG project)

Topics

- ◆ Elements to take into account before writing scenarios
- ◆ Example of “tools” to describe scenarios

Scenarios are a means of
communication
between involved parties.

How do we Communicate?

- ◆ Written form
 - Description text
- ◆ Oral/Verbal form
 - Tape recording
 - Video
- ◆ Visual form
 - Drawing
 - Video recording
 - PowerPoint
 - Flash animation
 - ...

Scenarios can use any communication form.

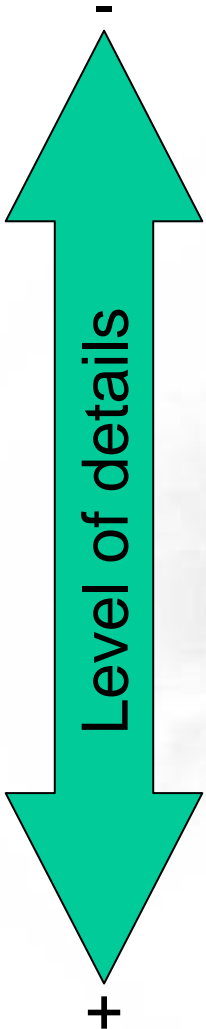

The form should be selected according to the audience and the purpose of the scenario :
Advertisement, Training, In-depth description...

What do we Communicate in a scenario?

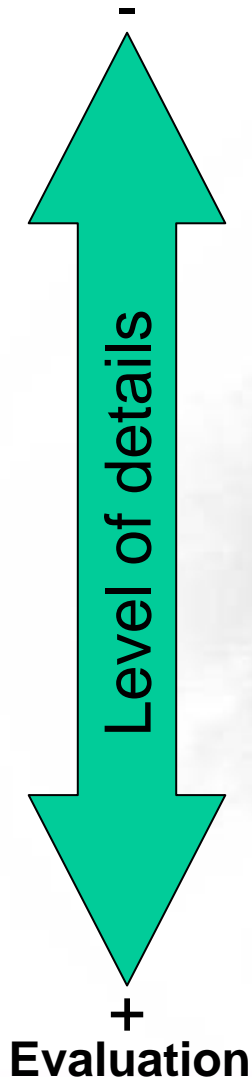

Elements that should be communicated by a scenario:

- 
- ◆ Genre
 - ◆ Purpose and Expected outputs
 - ◆ Context
 - Time
 - “Scene” (Location, Decor...)
 - Characters (Actors, roles and responsibilities)
 - ◆ Action
 - Event focus
 - Chain of Events
 - Rhythm

To Whom do we Communicate?

Information

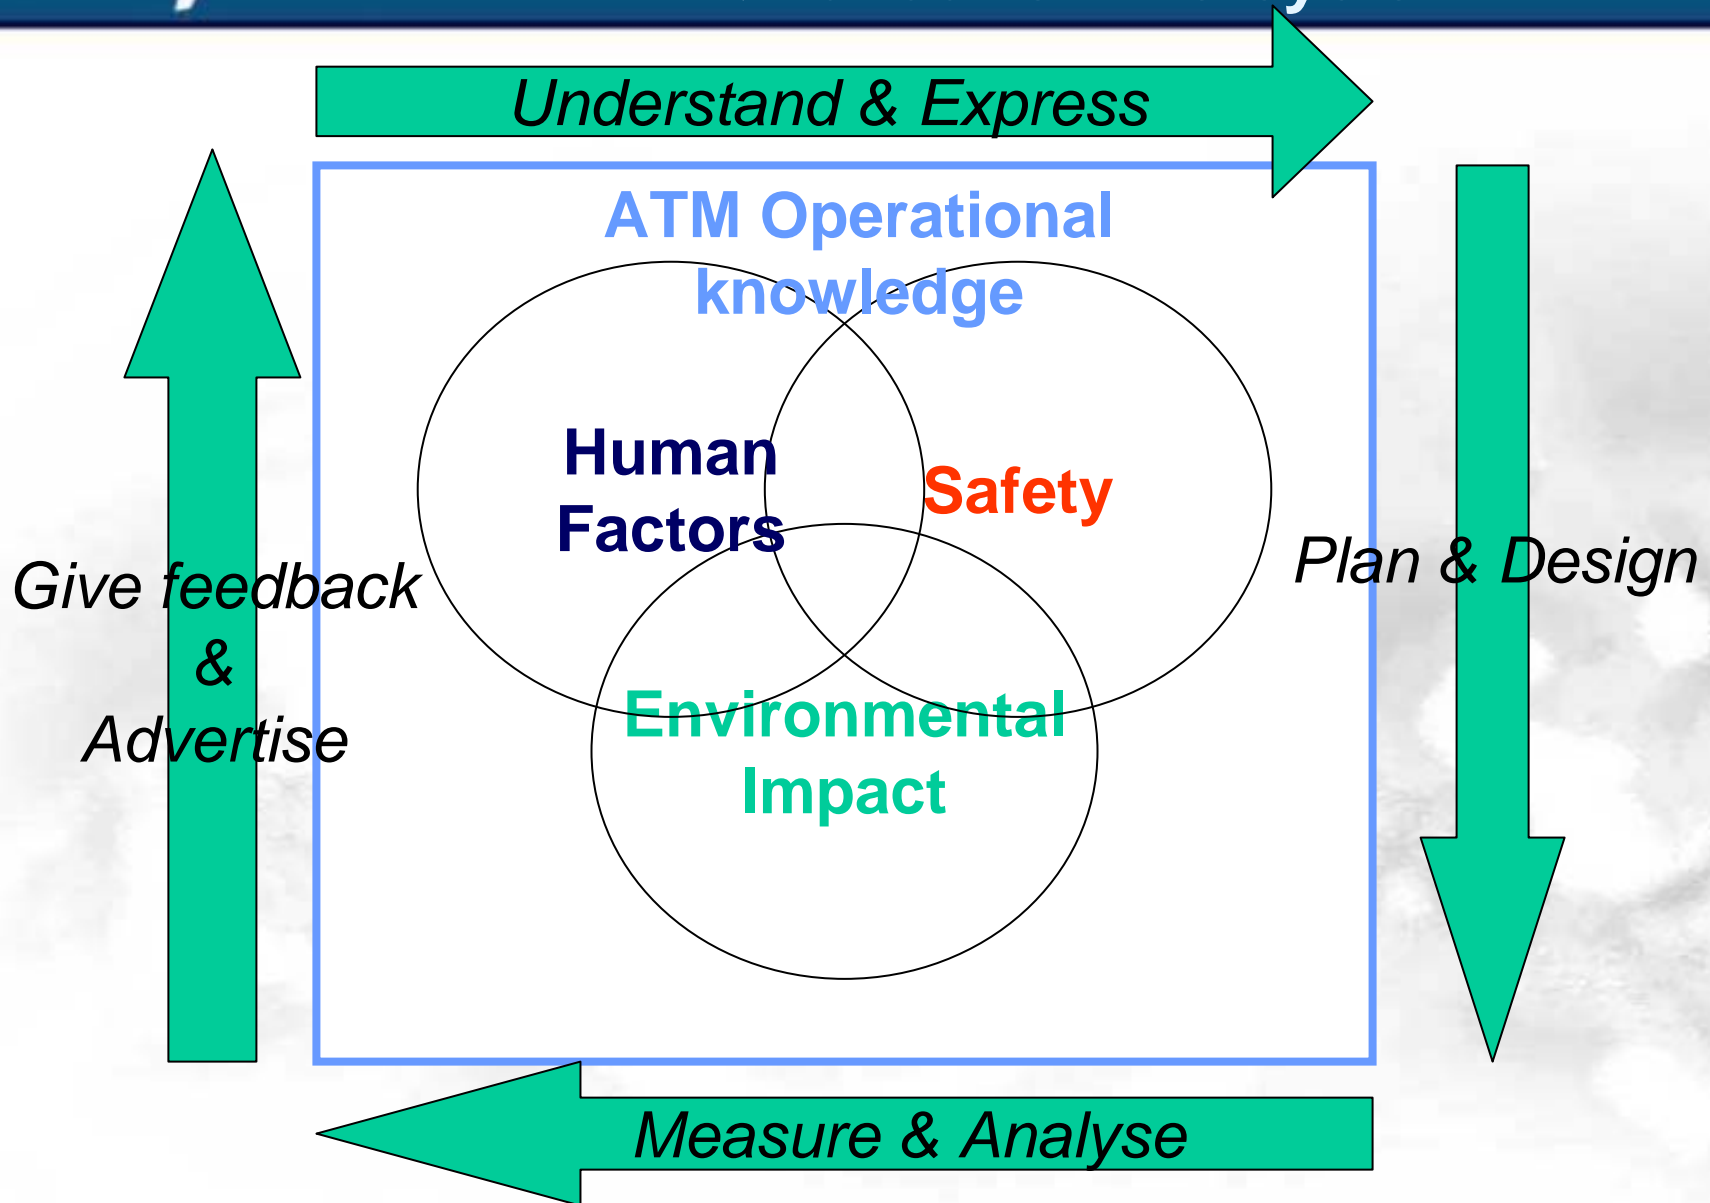

- ◆ Decision makers / Managers
 - Focus on the decision making variables (Generalisation, Cost, System Performances, Time of availability)
 - Validated (Yes/No)
- ◆ Public
 - Focus on Cost, Delay, Safety & Environment
- ◆ Actors of the ATM system (ATCOs & Pilots)
 - Focus on the operational aspects
 - Risk Management, Workload Management, & Level of Service
- ◆ Subject Matters Experts / Experimenters
 - Focus on the experimental aspects
 - Validity & Reliability

Scenarios are a means
to support
the overall validation life-cycle.

Scenario description language & Validation life-cycle

The appropriateness of the scenarios
will be established by the
experiment's participants
and ...

it can be harsh!

10 rules to write a scenario

1. Look for existing scenarios before “reinventing the wheel”; Make reference to them.
2. Determine the scenario’s purpose and the audience.
3. Choose a “method” to describe the scenario and stick to it.
4. Use the right level of information and the right type of representation according to the audience.
5. Stay focus on the purpose, don’t introduce irrelevant actors, O.I., events, ...
6. Use short, effective and active sentences.
7. Present things in sequence and give timing indications as much as possible.
8. Prepare it well before the experiment and Prepare backup scenarios in case of...
9. Check it and make it check by several people before testing it (ATCOs, Pilot & SMEs).
10. Evaluate the results according to the purpose. Is there any unexpected results? Was that a good scenario?

Good tools
for scenarios' description
should support
the static and dynamic aspects of
the ATM system.

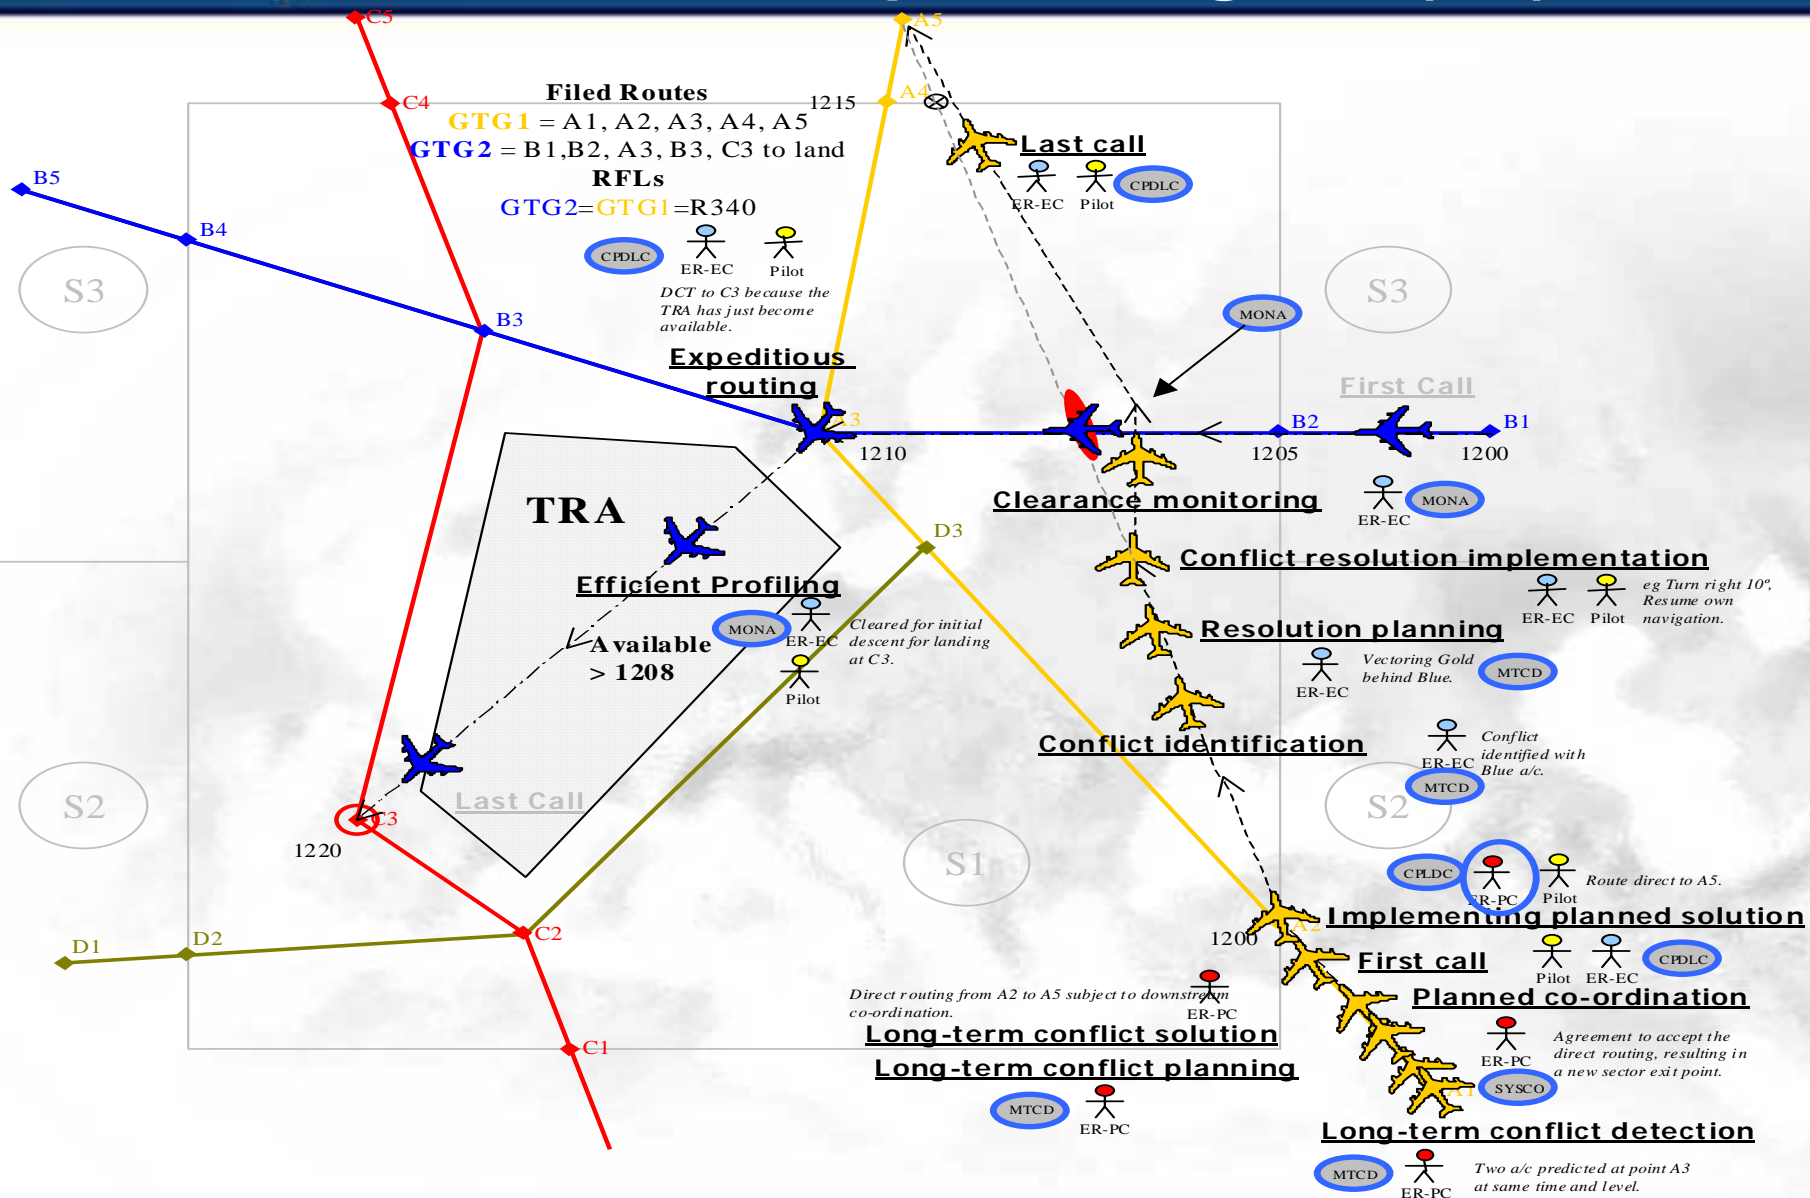

Using UML as a means to describe scenarios

- ◆ UML (Unified Modelling Language) can be used a basis for a common scenario's description language.
- ◆ List of description tools:
 - Graphical diagram
 - Talk through description
 - Task Matrix

 - Context diagram (UML package diagram)
 - Progression diagram (UML sequence diagram)
- ◆ The examples provided come from a work done by Nicholas HUNT within the Gate-To-Gate project.

Graphical diagram (1/2)

Graphical diagram (2/2)

“Talk through”

The diagram is made from the Sector 1 viewpoint and represents this scenario:

- ◆ Sector 1 is an enclosed sector bordered on either side and to the south by sector 2, and on either side and to the north by sector 3. All sectors are en-route sectors, S1 has a TMA below for traffic routing to/from a small airport at point C3. Each sector contains an ER-PC and ER-EC, however unless otherwise stated ER-PC and ER-EC correspond to the respective actors in S1.
- ◆ GTG1, the gold aircraft, has a planned routing from point A1 along route A (gold route) to exit the sector at point A4, continuing on to point A5 and beyond. GTG2, the blue aircraft, has a planned routing from point B1 to point B3, before joining route C to land at point C3. Both aircraft are cruising at their RFL of FL340 and are of similar type. The TRA is active until further notice.
- ◆ The scenario begins with GTG1 in S2 approaching S1, and with GTG2 in S3 approaching S1. Both upstream sectors have a Letter of Agreement (LoA) with S1 and both aircraft are complying with the conditions of the agreement, hence no explicit co-ordination has been performed.

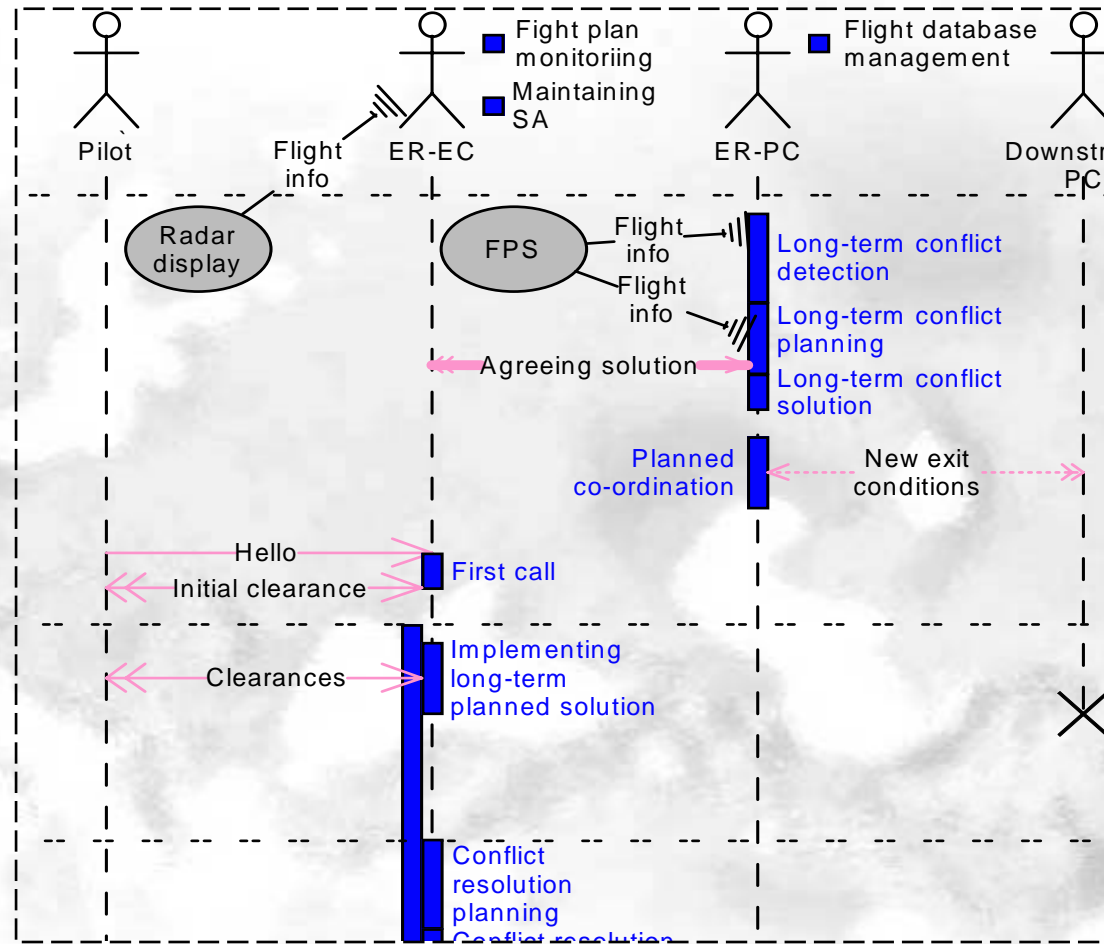

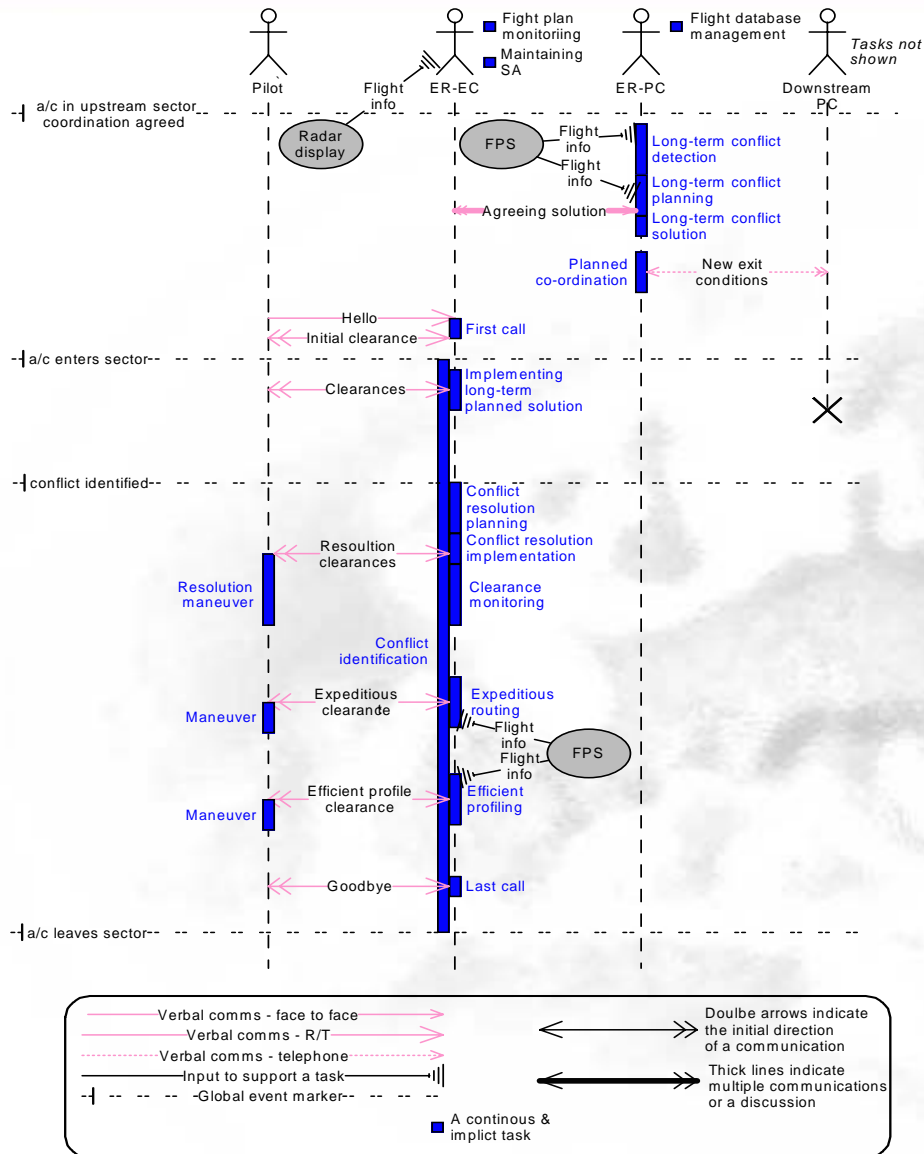

Configurations Tasks

1		Radar surveillance
2	Maintaining Situational Awareness	Flight data surveillance
3		Communications monitoring
4		Environment Awareness
5	Provide optimum service to A/C	Expeditious routing eg. DCT
6		Efficient profile eg. optimal FL
7	Flight Database Management	Flight information updates
8		Integrity checking
9		Estimate updates
10		Planned co-ordination
11	Co-ordination	Radar handover
12		Peak period co-ordination support
13	Conflict Search	Long-term detection
14		Intra-sector identification
15		Alert Response
16	Planning of conflict solutions	Long-term
17		Intra-sector resolution
18		Conflict resolution implementation
19	Communication of clearances	Implementing long-term planned solutions
20		Expeditious routing
21		Efficient profile
22	Deviation from flight track monitoring	Clearance monitoring
23		Flight plan monitoring
24	Other Communication	First Call (Hello)
25		Last Call (Goodbye)
26		Requests
27		Reports
28	Suite configuration management	Workload assessment
29		Suite/ACC Configuration

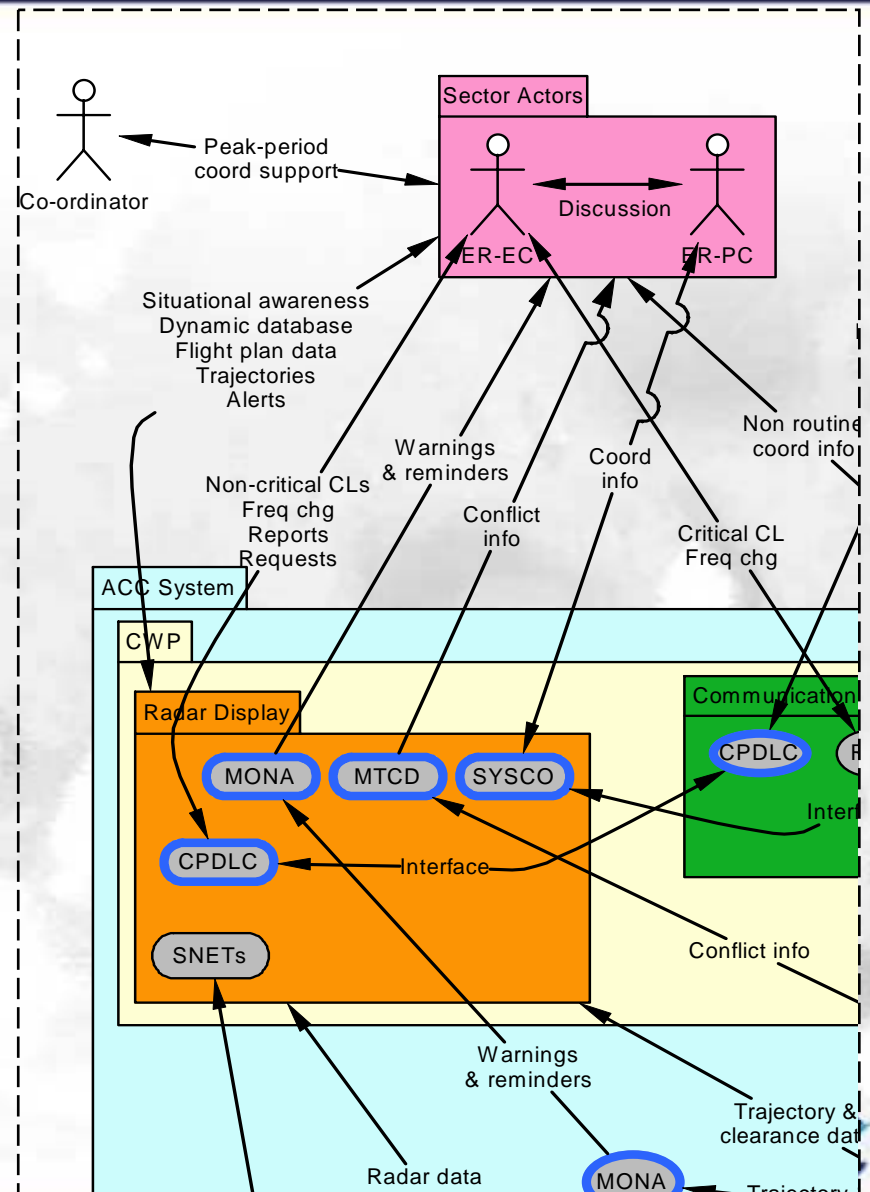

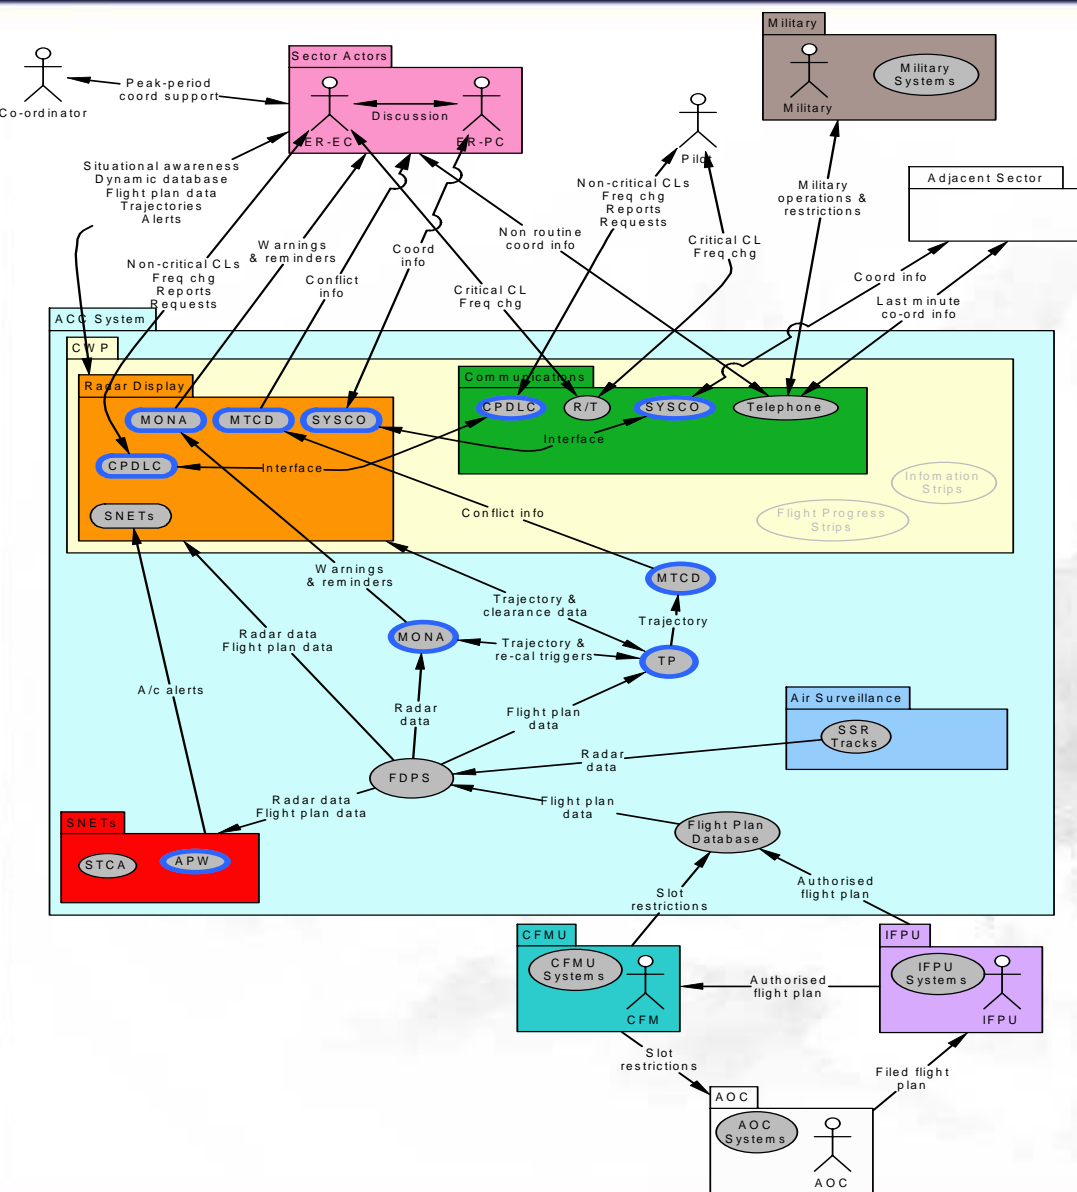

Basic Baseline v0.7 ER-PC / ER-EC / CO				
Main actor	Means of addressing the task	Other actors	Comms	Systems
PC/EC	Cognitive			Radar
PC/EC	Cognitive			FPS
PC/EC	Cognitive		Ear	
PC/EC	Cognitive
